

When connecting your mirror to the mains lighting circuit, the green area shown above represents the safe zone for you to drill and connect to your power cable. There is not a small, exact cable entry that you have to align with - and this gives you greater flexibility when it comes to fitting/connecting your mirror to the mains.

The interior of the rear frame is an open cavity and is not enclosed. This area can also be used to house any excess cable, once you have connected to your mains circuit.
